

Restriction Endonuclease Aat II

From Acetobacter aceti

Cat. No. 10 775 207 001

250 units (1-5 U/μl)

◯ Version 18Content version: February 2016

Store at -15 to -25°C

Stability/Storage

The undiluted enzyme solution is stable when stored at -15 to -25° C through the expiration date printed on the label. Do not store below -25° C to avoid freezing. **Note:** The product is shipped on dry ice.

Sequence specificity

Aat II recognizes the sequence GAC*GT/C* and generates fragments with 3'-cohesive termini (1).

Compatible ends

The enzyme is not known to generate compatible ends.

Isoschizomers

Aat II is an isoschizomer to Ssp 5230 I.

Methylation sensitivity

Aat II is inhibited by the presence of 5-methylcytosine at either C residue, as indicated (*).

Storage buffer

10 mM Tris-HCl, 50 mM KCl, 0.1 mM EDTA, 10 mM 2-mercaptoethanol, 0.06% polydocanol (w/v), 50% glycerol (v/v), pH 7.5 (at 4°C).

Incubation buffer (10x, included)

330 mM Tris-acetate, 660 mM K-acetate, 100 mM Mg-acetate, 5 mM dithiothreitol, pH 7.9 (at 37°C), (≜ SuRE/Cut **Buffer A**).

Activity in SuRE/Cut Buffer System

Bold face printed buffer indicates the recommended buffer for optimal activity:

Α	В	L	M	Н
100%	0-10%	0-10%	10-25%	0-10%

Incubation temperature

37°C

Unit definition

One unit is the enzyme activity that completely cleaves 1 μ g λ DNA in 1 h at 37°C in SuRE/Cut buffer A in a total volume of 25 μ l.

Typical experiment

Component	Final concentration
DNA	1 μg
10 × SuRE/Cut Buffer A	2.5 μl
Sterile redist. water	Up to a total volume of 25 μl
Restriction enzyme	1 unit

Incubate at 37°C for 1 h.

Heat Inactivation

The enzyme can be heat-inactivated by heating to 65°C for 15 min.

Number of cleavage sites on different DNAs (2):

λ	Ad2	SV40	Φ X174	M13mp7	pBR322	pBR328	pUC18
10	3	0	1	0	1	1	1

PFGE tested

Aat II has been tested in Pulsed Field Gel Electrophoresis (test system bacterial chromosomes). For cleavage of genomic DNA (E. coli C 600) embedded in agarose for PFGE analysis 10 units of enzyme/μg DNA and 4 h incubation time are recommended.

Ligation and recutting assay

Aat II fragments obtained by complete digestion of 1 μ g pBR322 DNA are ligated with 0.1 units T4-DNA ligase (Cat. No. 10 481 220 001) in a volume of 10 μ l by incubation for 16 h at 4°C in 66 mM Tris-HCl, 5 mM MgCl₂. 1 mM dithioerythritol, 1 mM ATP, pH 7.5 (at 20°C) resulting in >90 % recovery of 1 μ g pBR322 DNA× Aat II fragments.

Subsequent re-cutting with Aat II yields > 90% of the typical pattern of pBR322 DNA × Aat II fragments.

Troubleshooting

A critical component is the DNA substrate. Many compounds used in the isolation of DNA *e.g.* phenol, chloroform, EtOH, SDS, high levels of NaCl, metals (*e.g.* Hg²⁺, Mn²⁺) inhibit or alter recognition specificity of many restriction enzymes. Such compounds should be removed by EtOH precipitation followed by drying, before the DNA is added to the restriction digest reaction. Appropriate mixing of the enzyme is recommended.

Quality control

Lot-specific certificates of analysis are available at www.lifescience.roche.com/certificates

Absence of unspecific endonuclease activities

Absence of 5'-exonuclease/ 5'-phosphatase

5'-|"2"P] terminally labeled \times \text{Hpa II fragments are incubated with \(Aat \) II for 4 h at 37°C in SuRE/Cut buffer A. Under these conditions, no release of radioactivity is detectable, as stated in the certificate of analysis.

Absence of 3'-exonuclease activity

activities

1 μ g λ DNA is incubated for 16 h in 50 μ l SuRE/Cut buffer A with excess of *Aat* II. The number of enzyme units which do not change the enzyme-specific pattern is stated in the certificate of analysis.

5′-[³²P] terminally labeled $\lambda \times Hpa$ II fragments are

3'-[32 P] terminally labeled $\lambda \times$ *Hpa* II fragments are unbated with *Aat* II for 4 h at 37°C in SuRE/Cut buffer A. Under these conditions, no release of radioactivity is detectable, as stated in the certificate of analysis.
