Product Information

# HRV-3C Protease

N-Terminal His tagged recombinant protein, aqueous solution, 0.8-1.2 mg/mL

**SAE0045**

## Product Description

Synonym: Human Rhinovirus 3C Protease, Levlfqgp site protease, PreScission Protease

HRV-3C protease from human Rhinovirus Type 14 is a protease that specifically cleaves within the following eight-residue recognition sequence:

↓

Leu-Glu-Val-Leu-Phe-Gln-Gly-Pro

Proteolytic cleavage occurs between the Gln and Gly residues.[1] HRV-3C protease is a useful tool to cleave recombinant proteins that are expressed as fusion proteins with this sequence between the carrier domain and the protein of interest.[2]

This recombinant HRV-3C protease has a molecular mass of ~21 kDa. It contains a six-histidine tag (His-tag) to allow for removal by IMAC chromatography, such as with HIS-Select® or His•Bind® products. Several theses[3-4] and references[5-6] cite use of this SAE0045 HRV-3C protease product in their research protocols.[3-4]

## Reagent

The product is supplied in aqueous buffer, in a protein concentration range of 0.8-1.2 mg/mL, containing 50 mM Trizma-HCl (pH 7.5), 0.15 M NaCl, 1 mM TCEP, and 50% (v/v) glycerol. For the exact concentration, please refer to the lot-specific Certificate of Analysis for your specific lot number.

One unit of HRV-3C protease is defined as the amount of enzyme needed to digest 1 nmole of the substrate peptide H-Glu-Ala-Leu-Phe-Gln-pNA per hour at 0 °C, in a reaction buffer containing 25 mM HEPES (pH 7.5), 150 mM NaCl, 1 mM EDTA, and 1 mM DTT.

### Storage/Stability

The product retains activity for at least 2 years when stored at -20 °C.

## Procedure

HRV-3C protease is active under a wide range of pH values, ionic strengths, and temperatures. This protease retains high activity even at 0 °C, making it an optimal choice for temperature-sensitive proteins. However, the activity toward substrate proteins may differ depending on the substrate identity and reaction conditions.

The presence of low concentrations of a reducing agent in the reaction buffer is highly desirable, to keep the enzyme active in prolonged incubations. It is recommended to use 0.2-1 mM DTT in the reaction buffer for optimal results.

A good starting point for optimization is to use 1 µg of HRV-3C protease per 100 µg of target protein for 1 hour at 0-8 °C, or 1 µg of HRV-3C protease per 500 µg at 0-8 °C for 12-24 hours.

Temperatures up to 30 °C can be used for faster digestion. Protease activity is ~5× higher at 30 °C versus 0-8 °C. However, protease and substrate stability might be compromised.

## Precautions and Disclaimer

For R&D use only. Not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.
