# **Product Information**

RSK1, Active human, recombinant GST-tagged, expressed in *Sf*9 cells

Catalog Number **R1031** Lot Number 019K1594 Storage Temperature –70 °C

Synonyms: RPS6KA1; HU-1; MAPKAPK1A; S6K-alpha 1

#### **Product Description**

RSK1 is a member of the RSK (ribosomal S6 kinase) family that consists of growth factor-regulated serine/threonine kinases. RSK1 contains 2 non-identical kinase catalytic domains. RSK1 phosphorylates various substrates, including members of the mitogen-activated kinase (MAPK) signaling pathway. RSK1 encodes a predicted 735-amino acid protein containing 2 distinct consensus ATP-binding site sequences. RSK1 transcript is present in lymphocytes, skeletal muscle, liver, and adipose tissue.<sup>1</sup> RSKs are implicated in the activation of the mitogen-activated kinase (MAPK) cascade and the stimulation of cell proliferation and differentiation.<sup>2</sup>

Recombinant full-length human RSK1 was expressed by baculovirus in Sf9 insect cells using an N-terminal GST tag. The gene accession number is NM 002953. It is supplied in 50 mM Tris-HCI, pH 7.5, with 150 mM NaCI, 0.25 mM DTT, 0.1 mM EGTA, 0.1 mM EDTA, 0.1 mM PMSF, and 25% glycerol.

Molecular mass: ~108 kDa

Purity: ≥70% (SDS-PAGE, see Figure 1)

Specific Activity: 159-215 nmole/min/mg (see Figure 2)

#### **Precautions and Disclaimer**

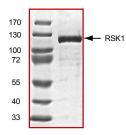

This product is for R&D use only, not for drug, household, or other uses. Please consult the Material Safety Data Sheet for information regarding hazards and safe handling practices.

#### Storage/Stability

The product ships on dry ice and storage at -70 °C is recommended. After opening, aliquot into smaller quantities and store at -70 °C. Avoid repeated handling and multiple freeze/thaw cycles.

### Figure 2.

Specific Activity of Lot Number 019K1594: 187 nmole/min/mg

### Procedure

**Preparation Instructions** 

Kinase Assay Buffer – 25 mM MOPS, pH 7.2, 12.5 mM glycerol 2-phosphate, 25 mM MgCl<sub>2</sub>, 5 mM EGTA, and 2 mM EDTA. Just prior to use, add DTT to a final concentration of 0.25 mM.

Kinase Dilution Buffer – Dilute the Kinase Assay Buffer 5-fold with water.

Kinase Solution – Dilute the Active RSK1 ( $0.1 \mu g/\mu l$ ) with Kinase Dilution Buffer to the desired concentration. Note: The lot-specific specific activity plot may be used as a guideline (see Figure 2). It is recommended that the researcher perform a serial dilution of Active RSK1 kinase for optimal results.

10 mM ATP Stock Solution – Dissolve 55 mg of ATP in 10 ml of Kinase Assay Buffer. Store in 200  $\mu l$  aliquots at –20 °C.

 $\gamma$ -<sup>32</sup>P-ATP Assay Cocktail (250  $\mu$ M) – Combine 5.75 ml of Kinase Assay Buffer, 150  $\mu$ l of 10 mM ATP Stock Solution, 100  $\mu$ l of  $\gamma$ -<sup>32</sup>P-ATP (1 mCi/100  $\mu$ l). Store in 1 ml aliquots at –20 °C.

Substrate Solution – Dissolve the synthetic peptide substrate (KRRRLASLR) in water at a final concentration of 1 mg/ml.

1% phosphoric acid solution – Dilute 10 ml of concentrated phosphoric acid to a final volume of 1 L with water.

#### Kinase Assay

This assay involves the use of the <sup>32</sup>P radioisotope. All institutional guidelines regarding the use of radioisotopes should be followed.

- 1. Thaw the Active RSK1, Kinase Assay Buffer, Substrate Solution, and Kinase Dilution Buffer on ice. The  $\gamma$ -<sup>32</sup>P-ATP Assay Cocktail may be thawed at room temperature.
- In a pre-cooled microcentrifuge tube, add the following solutions to a volume of 20 μl:
  - 10 µl of Kinase Solution
  - 10 µl of Substrate Solution
- Set up a blank control as outlined in step 2, substituting 10 μl of cold water (4 °C) for the Substrate Solution.
- 4. Initiate each reaction with the addition of 5  $\mu$ l of the  $\gamma$ -<sup>32</sup>P-ATP Assay Cocktail, bringing the final reaction volume to 25  $\mu$ l. Incubate the mixture in a water bath at 30 °C for 15 minutes.
- 5. After the 15 minute incubation, stop the reaction by spotting 20  $\mu$ l of the reaction mixture onto an individually precut strip of phosphocellulose P81 paper.

- 6. Air dry the precut P81 strip and sequentially wash in the 1% phosphoric acid solution with constant gentle stirring. It is recommended the strips be washed a total of 3 times of ~10 minutes each.
- 7. Set up a radioactive control to measure the total  $\gamma^{-32}$ P-ATP counts introduced into the reaction. Spot 5 µl of the  $\gamma^{-32}$ P-ATP Assay Cocktail on a precut P81 strip. Dry the sample for 2 minutes and read the counts. Do not wash this sample.
- 8. Count the radioactivity on the P81 paper in the presence of scintillation fluid in a scintillation counter.
- 9. Determine the corrected cpm by subtracting the blank control value (see step 3) from each sample and calculate the kinase specific activity

#### Calculations:

1. Specific Radioactivity (SR) of ATP (cpm/nmole)

SR = cpm of 5 μl of γ-<sup>32</sup>P-ATP Assay Cocktail nmole of ATP cpm – value from control (step 7) nmole – 1.25 nmole (5 μl of 250 μM ATP Assay Cocktail)

2. Specific Kinase Activity (SA) (nmole/min/mg)

nmole/min/mg =  $\frac{\Delta \text{cpm} \times (25/20)}{\text{SR} \times \text{E} \times \text{T}}$ 

SR = specific radioactivity of the ATP (cpm/nmole ATP)  $\triangle$ cpm = cpm of the sample – cpm of the blank (step 3) 25 = total reaction volume

- 20 = spot volume
- T = reaction time (minutes)

E = amount of enzyme (mg)
