Store at -15 to -25 °C

Stability/Storage	The undiluted enzyme solution is stable when stored at -15 to -25 °C until the control date printed on the label. Do not store below -25 °C to avoid freezing. Note: Product is shipped on dry ice.	Heat inactivation	<i>Bgl</i> II can not be heat-inactivated by 15 min incubation at 65 °C.																
Sequence specificity	<i>Bgl</i> II recognizes the sequence A/GATCT and generates fragments with 5'-cohesive termini (1).	Number of cleavage sites on different DNAs (2):	<table border="1"><thead><tr><th>λ</th><th>Ad2</th><th>SV40</th><th>Φ X174</th><th>M13mp7</th><th>pBR322</th><th>pBR328</th><th>pUC18</th></tr></thead><tbody><tr><td>6</td><td>11</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td></tr></tbody></table>	λ	Ad2	SV40	Φ X174	M13mp7	pBR322	pBR328	pUC18	6	11	0	0	1	0	0	0

Compatible ends	<i>Bgl</i> II generates compatible ends to <i>BamH</i> I, <i>Bcl</i> I, <i>Nde</i> II, <i>Sau3</i> A and <i>Xho</i> II.	Activity in PCR buffer	Relative activity in PCR mix (Taq DNA Polymerase buffer) is 0%. The PCR mix contained λ target DNA, primers, 10 mM Tris-HCl (pH 8.3, 20 °C), 50 mM KCl, 1.5 mM MgCl ₂ , 200 μ M dNTPs, 2.5 U Taq DNA polymerase. The mix was subjected to 25 amplification cycles.

Isoschizomers	The enzyme is not known to have isoschizomers.	Ligation and recutting assay	<i>Bgl</i> II fragments obtained by complete digestion of 1 μ g λ DNA are ligated with 1 U T4-DNA ligase (Cat. No. 10 481 220 001) in a volume of 10 μ l by incubation for 16 h at 4 °C in 66 mM Tris-HCl, 5 mM MgCl ₂ , 5 mM Dithiothreitol, 1 mM ATP, pH 7.5 (at 20 °C) resulting in >80 % recovery of 1 μ g λ DNA \times <i>Bgl</i> II fragments. Subsequent re-cutting with <i>Bgl</i> II yields >95% of the typical pattern of λ DNA \times <i>Bgl</i> II fragments.																
Methylation sensitivity	<i>Bgl</i> II is not inhibited by overlapping dam ⁺ methylation (°), but is sensitive to 5-methyl and 5-hydroxymethylcytosine, as indicated (*).	Troubleshooting	A critical component is the DNA substrate. Many compounds used in the isolation of DNA e.g. phenol, chloroform, EtOH, SDS, high levels of NaCl, metals (e.g. Hg ²⁺ , Mn ²⁺) inhibit or alter recognition specificity of many restriction enzymes. Such compounds should be removed by EtOH precipitation followed by drying, before the DNA is added to the restriction digest reaction. Appropriate mixing of the enzyme is recommended.																
Storage buffer	20 mM Tris-HCl, 200 mM NaCl, 1 mM EDTA, 10 mM 2-Mercaptoethanol, 0.01% Polydocalanol (v/v), 50% Glycerol (v/v), pH approx. 7.5 (at 4 °C).	Quality control	Lot-specific certificates of analysis are available at www.lifescience.roche.com/certificates																
Incubation buffer (10x, included)	100 mM Tris-HCl, 500 mM NaCl, 100 mM MgCl ₂ , 10 mM Dithioerythritol, pH 7.5 (at 37 °C), (= SuRE/Cut Buffer M)	Absence of unspecific endonuclease activities	1 μ g λ DNA is incubated for 16 h in 50 μ l SuRE/Cut buffer H with excess of <i>Bgl</i> II. The number of enzyme units which do not change the enzyme-specific pattern is stated in the certificate of analysis.																
Activity in SuRE/Cut Buffer System	Bold face printed buffer indicates the recommended buffer for optimal activity:	Absence of exonuclease activity	Approx. 5 μ g [³ H] labeled calf thymus DNA are incubated with 3 μ l <i>Bgl</i> II for 4 h at 37 °C in a total volume of 100 μ l 50 mM Tris-HCl, 10 mM MgCl ₂ , 1 mM Dithioerythritol, pH approx. 7.5. Under these conditions, no release of radioactivity is detectable, as stated in the certificate of analysis.
