# **Product Information**

PAK1, active, GST tagged, human PRECISIO<sup>®</sup> Kinase recombinant, expressed in *Sf*9 cells

Catalog Number **SRP5246** Storage Temperature –70 °C

Synonyms: PAKalpha, MGC130000, MGC130001

#### Product Description

PAK1 is a member of the p21-activated kinases (PAKs), which have been implicated in the regulation of cell morphology, motility, and transformation. These serine/threonine kinases are activated by and are effectors of small GTPases, CDC42 and RAC. PAK1 belongs to the Group I PAKs, which also includes PAK2 and PAK3.<sup>1</sup> PAK1 is a key regulator of the actin cytoskeleton, adhesion, and cell motility. Inactive dimeric PAK1 is mainly cytosolic and interaction with the activators Cdc42-GTP and Rac1-GTP stimulates the kinase at the sites of cellular protrusions forming adhesions to the extracellular matrix.<sup>2</sup>

Recombinant full-length human PAK1 was expressed by baculovirus in *Sf9* insect cells using an N-terminal GST tag. PAK1 has been activated *in vivo*. The gene accession number is NM\_002576. Recombinant protein stored in 50 mM Tris-HCl, pH 7.5, 150 mM NaCl, 10 mM glutathione, 0.1 mM EDTA, 0.25 mM DTT, 0.1 mM PMSF, and 25% glycerol.

Molecular mass: ~95 kDa

Purity: 70–95% (SDS-PAGE, see Figure 1)

Specific Activity: 63-85 nmole/min/mg (see Figure 2)

#### **Precautions and Disclaimer**

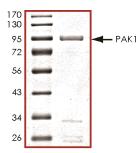

This product is for R&D use only, not for drug, household, or other uses. Please consult the Material Safety Data Sheet for information regarding hazards and safe handling practices.

#### Storage/Stability

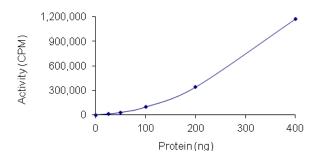

The product ships on dry ice and storage at -70 °C is recommended. After opening, aliquot into smaller quantities and store at -70 °C. Avoid repeated handling and multiple freeze/thaw cycles.

#### Figure 1.

### Procedure

**Preparation Instructions** 

Kinase Assay Buffer – 25 mM MOPS, pH 7.2, 12.5 mM glycerol 2-phosphate, 25 mM MgCl<sub>2</sub>, 5 mM EGTA, and 2 mM EDTA. Just prior to use, add DTT to a final concentration of 0.25 mM.

Kinase Dilution Buffer – Dilute the Kinase Assay Buffer 5-fold with a 50  $ng/\mu l$  BSA.

Kinase Solution – Dilute the active PAK1 ( $0.1 \mu g/\mu l$ ) with Kinase Dilution Buffer to the desired concentration. Note: The specific activity plot may be used as a guideline (see Figure 2). It is recommended the researcher perform a serial dilution of active PAK1 kinase for optimal results.

10 mM ATP Stock Solution – Dissolve 55 mg of ATP in 10 ml of Kinase Assay Buffer. Store in 200  $\mu$ l aliquots at –20 °C.

 $\gamma$ -<sup>33</sup>P-ATP Assay Cocktail (250  $\mu$ M) – Combine 5.75 ml of Kinase Assay Buffer, 150  $\mu$ l of 10 mM ATP Stock Solution, 100  $\mu$ l of  $\gamma$ -<sup>33</sup>P-ATP (1 mCi/100  $\mu$ l). Store in 1 ml aliquots at –20 °C.

Substrate Solution – Dissolve the synthetic peptide substrate in distilled water at a final concentration of 1 mg/ml.

1% phosphoric acid solution – Dilute 10 ml of concentrated phosphoric acid to a final volume of 1 L with water.

#### Kinase Assay

This assay involves the use of the <sup>33</sup>P radioisotope. All institutional guidelines regarding the use of radioisotopes should be followed.

- 1. Thaw the active PAK1, Kinase Assay Buffer, Substrate Solution, and Kinase Dilution Buffer on ice. The  $\gamma$ -<sup>33</sup>P-ATP Assay Cocktail may be thawed at room temperature.
- 2. In a pre-cooled microcentrifuge tube, add the following solutions to a volume of 20 μl:
  - 10 µl of Kinase Solution
  - 5 μl of Substrate Solution
  - $5 \mu$ l of cold water (4 °C)
- Set up a blank control as outlined in step 2, substituting 5 μl of cold water (4 °C) for the Substrate Solution.
- 4. Initiate each reaction with the addition of 5  $\mu$ l of the  $\gamma$ -<sup>33</sup>P-ATP Assay Cocktail, bringing the final reaction volume to 25  $\mu$ l. Incubate the mixture in a water bath at 30 °C for 15 minutes.
- 5. After the 15 minute incubation, stop the reaction by spotting 20  $\mu$ l of the reaction mixture onto an individually precut strip of phosphocellulose P81 paper.

- 6. Air dry the precut P81 strip and sequentially wash in the 1% phosphoric acid solution with constant gentle stirring. It is recommended the strips be washed a total of 3 times of ~10 minutes each.
- 7. Set up a radioactive control to measure the total  $\gamma^{-33}$ P-ATP counts introduced into the reaction. Spot 5 µl of the  $\gamma^{-33}$ P-ATP Assay Cocktail on a precut P81 strip. Dry the sample for 2 minutes and read the counts. Do not wash this sample.
- 8. Count the radioactivity on the P81 paper in the presence of scintillation fluid in a scintillation counter.
- 9. Determine the corrected cpm by subtracting the blank control value (see step 3) from each sample and calculate the kinase specific activity

#### Calculations:

1. Specific Radioactivity (SR) of ATP (cpm/nmole)

SR = <u>cpm of 5  $\mu$ l of  $\gamma$ -<sup>33</sup>P-ATP Assay Cocktail nmole of ATP</u>

cpm – value from control (step 7) nmole – 1.25 nmole (5  $\mu$ l of 250  $\mu$ M ATP Assay Cocktail)

2. Specific Kinase Activity (SA) (nmole/min/mg)

nmole/min/mg = 
$$\frac{\Delta \text{cpm} \times (25/20)}{\text{SR} \times \text{E} \times \text{T}}$$

SR = specific radioactivity of the ATP (cpm/nmole ATP)  $\triangle$ cpm = cpm of the sample – cpm of the blank (step 3) 25 = total reaction volume

20 = spot volume

T = reaction time (minutes)

E = amount of enzyme (mg)
